

## Wicking Bed Design

# WICKING BED

A Wicking Bed is a raised bed garden which contains a water reservoir underneath the growing area. The water reservoir is made up of round rocks and perforated pipe, and is separated from the soil by a layer of landscaping fabric.

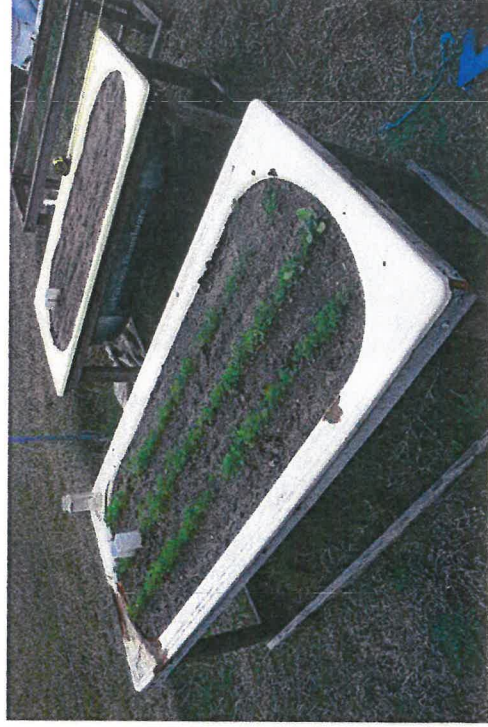

Water is automatically wicked upwards towards the top of the soil medium to irrigate the plants, which encourages deeper root growth and more drought resistant plants, while also significantly reducing the maintenance needs of the garden.
